HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A reconstruction of
Arnaudeau's table
of triangular numbers
(ca. 1896)

Denis Roegel

23 december 2014

1 Triangular numbers

A triangular (or trigonal) number N is such that its units can be assembled in a triangle. The first triangular numbers are $S_1 = 1$, $S_2 = 1 + 2 = 3$, $S_3 = 1 + 2 + 3 = 6$, $S_4 = 1 + 2 + 3 + 4 = 10$, $S_5 = 1 + 2 + 3 + 4 + 5 = 15$, etc. The general formula for triangular numbers is $S_n = \sum_{i=1}^n i = \frac{n(n+1)}{2}$.

2 Joncourt's table of triangular numbers (1762)

Élie de Joncourt was born in Middelburg (province of Zeeland, Netherlands) in 1697 and died in The Hague in 1765. He was trained as a pastor, was minister of the church of 's-Hertogenbosch, and also taught mathematics in the school of 's-Hertogenbosch.

He worked mainly as a journalist and translator, collaborating to several journals, and translating in French several English periodicals. He also translated a number of English books, in particular of physics and mathematics by Saunderson, 's Gravesande, and others.

Among Joncourt's more personal works is his treatise on the use of triangular numbers. This treatise was published in Latin [14], Dutch [12], English [15] and French [13].

Joncourt gives the triangular numbers for $n = 1$ to $n = 19999$, in two parts, for the ranges 1 to 9999 and for 10001 to 19999. There are 90 numbers per page, except on the last page of a range which contains only 9 numbers. There are a total of 224 pages, so that we have $2 \times (111 \times 90 + 9) = 19998$, the triangular number for 10000 not being given. After the table of triangular numbers, Joncourt gives a table of cubes from 1 to 600.

Joncourt's table was computed principally in order to facilitate the extraction of square and cubic roots [30]. It is easy to see that

$$S_n + S_{n+1} = \frac{1}{2} [n(n+1) + (n+1)(n+2)] = (n+1)^2$$

and therefore that Joncourt's table allows for the computation of squares. Square roots can be obtained by halving the number of which we desire the square root, and looking it up in the table. For instance, for the square root of 49, we seek 24.5 and the triangular number immediately above is 28, whose index is 7. When the number is not a perfect square, the square root can be obtained more precisely in several steps and Joncourt considers a number of cases.

3 The use of triangular numbers for multiplications

In the sixth chapter of the second part of his book, Joncourt describes how triangular numbers can be used to multiply two integers. In order to compute ab , Joncourt computes $(a+b)^2$, a^2 , b^2 , subtracts the latter two to the first square, obtains $2ab$ and divides the result by two. Using trigonal numbers, this can be achieved as follows:

$$(a + b)^2 = S_{a+b-1} + S_{a+b} \quad (1)$$

$$a^2 = S_{a-1} + S_a \quad (2)$$

$$b^2 = S_{b-1} + S_b \quad (3)$$

Hence

$$2ab = S_{a+b-1} + S_{a+b} - S_{a-1} - S_a - S_{b-1} - S_b \quad (4)$$

$$ab = \frac{S_{a+b-1} + S_{a+b} - S_{a-1} - S_a - S_{b-1} - S_b}{2} \quad (5)$$

Joncourt gives the following example: $a = 7589$, $b = 6757$, he finds $c = a + b = 14346$, then $c^2 = 205807716$, $a^2 = 57592921$, $b^2 = 45657049$, $c^2 - a^2 - b^2 = 102557746$, and $ab = 51278873$.

In 1889, Glaisher also remarked that a table of triangular numbers would be convenient for the computation of multiplications [18]. Such a table would then be as useful as a table of quarter-squares [51, 8, 9, 28, 23, 24, 5, 6, 32].

Glaisher gave the simpler formula

$$S_{a-1} + S_b - S_{a-b-1} = ab$$

with which a table of triangular numbers can be used to compute ab , with a and b not exceeding the limit of the table [49]. For instance, if we wish to compute 123×241 , we find

$$S_{240} = 28920 \quad (6)$$

$$S_{123} = 7626 \quad (7)$$

$$S_{117} = 6903 \quad (8)$$

and $S_{240} + S_{123} - S_{117} = 28920 + 7626 - 6903 = 29643 = 123 \times 241$.

Returning to Joncourt's example, only three table lookups are required with Glaisher's formula, instead of the six lookups implied by Joncourt:

$$S_{a-1} = 28792666 \quad (9)$$

$$S_b = 22831903 \quad (10)$$

$$S_{a-b-1} = 345696 \quad (11)$$

$$S_{a-1} + S_b - S_{a-b-1} = 28792666 + 22831903 - 345696 = 51278873 \quad (12)$$

A table of triangular numbers, like a table of quarter-squares, is much more compact than a full table of multiplications. With Glaisher's formula, a table giving the triangular numbers up to S_n can be used to compute ab for a and b smaller or equal to n . A full table of multiplication would require n^2 entries, or at least $n^2/2$ if we assume $a \leq b$.

4 Arnaudeau’s table of triangular numbers

At the beginning of the 1890s, Augustin-Armand Arnaudeau (1823–1909), an 1843 graduate of the French *École polytechnique*, computed a table of triangular numbers. His first project went only up to 10000 [11], but he eventually computed the triangular numbers up to 100000. This table was not published, except for some proofs in 1896 [2].¹

Little is known on Arnaudeau. He was a member of the *Société de statistique de Paris*, and *membre agrégé de l’Institut des Actuaire français*, as well as *chef du bureau de Statistique de la Compagnie générale transatlantique*. His manuscripts include a memoir on establishing a suspended postal tube between Dover and Calais (ca. 1887).²

Before working on triangular numbers, Arnaudeau published a guide on loans in 1892 [1]. This guide contained a number of tables. Later in 1906, he also published tables of compound interests [3]. And he was responsible for later editions of Violeine’s tables of compound interests, first published in 1859 [50].

Regarding triangular numbers, his project in 1896 was to publish them together with a table of reciprocals and a table of sines and tangents, both to 5 places [2]. The inclusion of reciprocals makes it possible to use the table of triangular numbers to perform divisions.

Finally, a table of triangulars can also be used to solve triangles, without the use of logarithms. This is why Arnaudeau planned to add to his table of triangulars a table of sines and tangents (for steps of 30’). His tangents are called “visuals” (*visuels*), but it is possible that he would have used “tangents” in print, as some of his drafts have the word crossed out. The initial project may have been restricted to tangents, but sines were soon added. From a known right-angled triangle, the ratio of the sides can be computed with the table of triangulars (and reciprocals), and a look-up in the table of sines or tangents then yields the sought angles. Moreover, the table of tangents can be used to compute reciprocals, since $\tan \alpha = \frac{1}{\tan(90-\alpha)}$.

In his unpublished notes, Arnaudeau gave a number of examples on how to use his tables. We have so far only reconstructed his table of triangular numbers. Its use straightforward, and we will restrict ourselves to one example. If we seek S_{16506} , we take the page containing 1650 in its left column and 6 in its header. At the intersection of the line 1650 and column 6, we read 2322.71, which denotes 232271, and this is prefixed by 136. The 16506th triangular number is therefore 136232271. As is usual in tables whose values involve prefixes, these prefixes are only given when they change. Moreover, if a prefix changes within a line, that line will appear broken. Other tablemakers often use special marks such as asterisks to denote the change of prefixes.

Arnaudeau’s papers also contain a draft cover of a table of multiplication [4], which would presumably have been a table of triangular numbers, perhaps shortened, and tailored for primary and secondary schools. An 8-page introduction explains the use of his table for multiplication, division, squares and square roots. This introduction was writ-

¹The manuscripts of Arnaudeau’s tables are kept in the library of the *École polytechnique* under the shelf mark Ms 9. There are in fact three tables: 1) *Table des triangulaires de 1 à 100000* (401 and 186 folios), 2) *Table des réciproques des nombres de 1 à 100000* (93 folios), 3) *Table des sinus et tangentes* (47 folios), as well as various notes and introductory material planned for the publication. We thank Olivier Azzola, who is in charge of the archives of the *École polytechnique*, for having arranged access to these manuscripts.

²*Mémoire sur l’Établissement d’un tube postal entre Douvres et Calais.*

ten in seven (!) languages: French, English, Italian, Spanish, Portuguese, German and Russian. It is interesting to see the effort put into a project which eventually didn't get published...

References

The following list covers the most important references³ related to Arnaudeau's table. Not all items of this list are mentioned in the text, and the sources which have not been seen are marked so. We have added notes about the contents of the articles in certain cases.

³**Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but we have not done it here.
